SUMMARY

Software engineer and technical lead with 10 years designing, building, and modernizing enterprise applications, from regulated financial systems at Wells Fargo and a high-traffic retail platform at JCPenney to client engagements where I own the architecture end to end. Hands-on in Python and Django, Java and Spring Boot, and TypeScript and Node.js, I set engineering standards, build reusable components, and mentor engineers.

LANGUAGES | FRAMEWORKS | TOOLS

Python, Java, TypeScript, JavaScript | Django, Spring Boot, React, Node.js | AWS, CloudFormation, Docker, GitHub Actions, PostgreSQL

EXPERIENCE

Software Consultant / Technical Lead — Lotnivo, Remote
March 2022 - Present

- Lead architecture and delivery on client engagements end to end, from technical direction, technology selection, and system design through build, release, and production support, while staying hands-on in the code.
- Architect and build backend services and REST APIs in Python with Django and in Java with Spring Boot, with relational data models in PostgreSQL, migrations, authentication and authorization, and request validation, alongside Node.js and TypeScript services.
- Modernize tightly coupled systems into modular, independently deployable services with clear API boundaries, versioned contracts, and event-driven processing between stages.
- Standardize how teams build: reusable component libraries and shared Python and TypeScript packages, coding standards, review practices, and a testing strategy (pytest, JUnit, Jest, Playwright) that keeps quality consistent across contributors.
- Apply DevSecOps practices on AWS (Lambda, S3, EC2): infrastructure defined as code with CloudFormation, Docker containers, and GitHub Actions CI/CD with automated test gates, required code review, and security built in from the start.
- Build AI-driven automation, including a multi-stage LLM agent pipeline with rule-based model routing and human-approval gates, and use AI coding agents daily under the same review bar as hand-written code.
- Partner with stakeholders and business owners on feasibility, scope, and delivery plans in Agile iterations, and mentor developers through pairing and code review.

Software Engineer — Wells Fargo, Charlotte, NC
May 2019 - June 2020

- Built and maintained backend REST services in Java with Spring Boot, implementing controller, service, and repository layers over relational data for internal financial applications.
- Built a Node.js and Express middleware layer between React front ends and Spring Boot services, handling session propagation, request validation, and error normalization across a large multi-team codebase.
- Partnered with security and compliance teams on secure coding and access patterns in a regulated environment, and implemented WCAG/ARIA accessibility and internationalization that expanded the usable audience by over 25%.

Software Engineer — JCPenney, Plano, TX
June 2017 - May 2019

- Refactored a legacy monolith into modular, component-driven architecture, improving scalability, performance, and long-term maintainability of a platform already in production.
- Built front-end features and integrated backend services for a high-traffic retail loyalty platform serving millions of users at e-commerce scale.
- Optimized performance and load times under heavy traffic, owning code quality through code reviews and production troubleshooting.

OPEN SOURCE & HACKATHONS

PA Expunger (PAX) — Code for Philly and Philadelphia Lawyers for Social Equity

- Open source web app that generates Pennsylvania criminal record expungement petitions by parsing county docket sheets, replacing manual petition drafting for the attorneys and volunteers who file them.
- Contributed to deploying the Python/Django application so PLSE attorneys can use the live demo.
- Worked in a containerized Django and React codebase with Docker Compose, pytest, and an image-based deployment pipeline to a Kubernetes cluster.
- Collaborated with volunteer contributors through GitHub issues, pull requests, and code review.
- **Full Project Tech Stack:** Python, Django, React, PostgreSQL, Docker Compose, pytest, GitHub Actions, Kubernetes

Think-Wide — AI Agent Hackathon, September 2026

- MCP tools and a web workbench giving coding agents verifiable cross-repo evidence, built on a contract-first architecture in TypeScript; 19 pull requests merged in one day behind 591 passing tests.
